

count 1's of the binary

```
def count_bits(n):  
    nbin = (bin(n))  
    result = 0  
    for i in nbin:  
        if i == '1':  
            result += 1  
    return result
```

So initially my mistake was i didn't wrap the 1 in "
this is because bin(n) converts an int to a str
